Purpose of Contact Discovery and disposition of ash material at concrete area south of Incinerator

Discussion

During removal of the contaminated concrete located south of the Incinerator, a small area with broken glass and other small debris was discovered along with some ash-like material. There is an elevated count associated with both the ash and the debris.

This material will be immediately removed from the area and placed in a waste container for shipment offsite. A radiological survey will be conducted after removal to determine if contaminated material is remaining. If present, this also will be removed. If the survey indicates that there are no remaining areas of elevated radiation levels, a sample will be collected from the soils where the removal occurred and analyzed for radionuclides using onsite gamma spectroscopy and for metals using an offsite laboratory. This will be used as a confirmation sample.
